

How to Open Pipeline

Follow these steps one at a time. It is easy.

1. Download it

Click the download link. You get a file called Pipeline.zip. It usually goes into your Downloads folder. Wait for it to finish.

2. Unzip it

Right-click Pipeline.zip and choose Extract All, then click Extract. This makes a normal folder called Pipeline. Move the whole folder somewhere permanent, such as your Documents folder.

3. Open the app

Open the Pipeline folder, find Pipeline.exe and double-click it.

4. If Windows shows a blue warning

The first time, Windows may say "Windows protected your PC". This is normal for free apps that are not code signed.

- Click More info
- Then click Run anyway

You only do this once.

5. The app opens

A window opens. The first time it may take a few seconds to get ready.

6. Log in

The first time, a small Notepad window opens by itself. It shows your email and a random password made just for you.

- Type them into Pipeline and click Log in.
- Click Change password in the top right and choose a password of your own.
- Pipeline then deletes the first_login.txt file for you. If you still see it, delete it. It is in the folder %USERPROFILE%\Pipeline Data (paste that into the File Explorer address bar).

Forgot your password? Close Pipeline, then double-click Pipeline-Reset-Password.bat in the same folder as Pipeline.exe. A new random password opens in Notepad. Log in, change it, and your contacts are not touched.

Keep your password somewhere safe, for example a password manager or a notebook that stays at home. Your contacts are stored on this computer only, so nobody else can recover them for you.

7. Pin it so it is easy to find next time

While Pipeline is open, look at the bar along the bottom of your screen. Right-click the Pipeline icon and choose Pin to taskbar. To add it to the Start menu, right-click Pipeline.exe, choose Show more options if you see it, then Pin to Start.

Now you can open Pipeline any time with one click. Done!
